

Nine Ways You Can Reduce Unnecessary Work & Make Your Job Easier—viewLinc™ Automated Monitoring, Alarming & Reporting

1. Visualize Your Environments in Real-Time

View live graphical data from any selected logger channel with one mouse click. Or view previous data using historical data generator. No extra steps to create trend views.

2. Historical and Alarm Reporting When and Where You Want

Automate reporting with email delivery of reports based on historical values. Imagine not having to remember to get reports. Automate reporting to the schedule you want.

3. Easy Browser-based Graphic Reports

Generate reports for all historical data and trending needs. No additional software needed.

4. Focus on Alarm History Specifics

Display alarm reports filtered by Zone, Logger Description, Date/Time. Save time by reviewing only the alarms for your area of responsibility.

5. Comments You Can Read

Set up common reasons for alarms and actions in a menu to ensure reporting consistency. No need to struggle with a user's interpretation of a problem.

6. Edit Alarm Thresholds as a Group

Set up multiple alarm limits in a template and assign it to multiple loggers—another time-saver.

7. Audit Trail for 21 CFR Part 11 Compliance

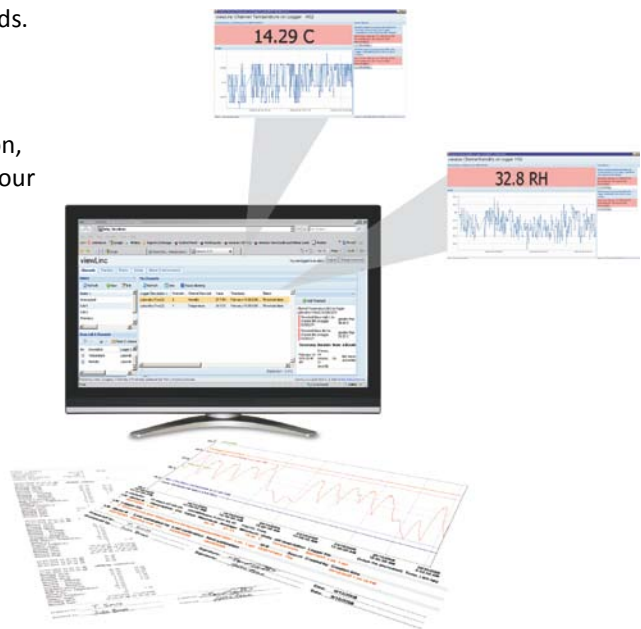

Peace of mind knowing that the system's audit trail checks for any alterations to recorded data files.

8. Instruments Travel with the Chamber

Loggers are associated to a Descriptor or Zone and when swapped out for calibration (or any other reason) they retain all related information: description, alarm limits, delays, transfers, email settings and external run commands.

9. Automatic Calibration Notification

You can ask the system to notify you when each recorder is coming due for calibration automatically via email—one less thing to remember for maintaining regulatory compliance.
