

## Seven Important Ways to Stay in Compliance and Preserve Your Time— vLog™ Validation Software

### 1. Results at a Glance

Limit bars on the graph tell you whether the run was within specification. Horizontal bars move automatically with min, max, and avg values. Separately, you can superimpose up to 4 indicators wherever you want—set the value, units (temp or RH), label, and color for each indicator. It's a convenient visual for a quick check on your results.

### 2. More Informative Graphs

Add statistics to your graphs such as min, max, and avg values. And use more explanation in the signoff area with up to 6 lines of text to describe the run.

### 3. More Report Statistics

Include more statistics on a report. Add max minus min value, max minus avg value, avg minus min value, group statistics, and lethality to other common statistics. Reports give you flexibility to communicate results.

### 4. Industry-standard Security Control

Compliance with strict regulatory guidelines or inspection SOPs demands secure data and reports. vLog uses all the capabilities of Windows password authentication—domain level or local account authentication. Your IT staff can implement what they already use to protect other company assets.

### 5. Indicates Security Status of Files

Every report identifies the security status of the data. You know whether files are secure or not, and if files have security problems or tampering issues. It's easy to know the type of file you are working with.

### 6. Traceable Interaction with Your System

vLog provides a validated audit trail. A built-in audit trail report generator creates reports—for all logger data or over a specified time period. No interaction goes unrecorded.

### 7. Batch Setup for Multiple Data Loggers

Use the settings from one logger in additional data loggers—start and stop time, sample interval, logger and channel descriptions, and channel flags. Saves you setup time.
